

IMA Commission on New Minerals, Nomenclature and Classification (CNMNC) – Newsletter 63

Ritsuro Miyawaki¹, Frédéric Hatert², Marco Pasero³, and Stuart J. Mills⁴

¹Chairman, CNMNC | Department of Geology, National Museum of Nature and Science,
4-1-1 Amakubo, Tsukuba 305-0005, Japan

²Vice-Chairman, CNMNC | Laboratoire de Minéralogie, Université de Liège,
Bâtiment B18, Sart Tilman, 4000 Liège, Belgium

³Vice-Chairman, CNMNC | Dipartimento di Scienze della Terra, Università di Pisa,
Via Santa Maria 53, 56126 Pisa, Italy

⁴Secretary, CNMNC | Geosciences, Museum Victoria, P.O. Box 666, Melbourne, Victoria 3001, Australia

Correspondence: Marco Pasero (marco.pasero@unipi.it)

Received: 23 September 2021 – Published: 25 October 2021

The information given here is provided by the IMA Commission on New Minerals, Nomenclature and Classification for comparative purposes and as a service to mineralogists working on new species.

Each mineral is described in the following format:

- mineral name, if the authors agree on its release prior to the full description appearing in press;
- chemical formula (ideal formula);
- mineral symbol;
- type locality;
- full authorship of proposal;
- e-mail address of corresponding author;
- relationship to other minerals;
- crystal system, space group, structure determined (yes or no);
- unit-cell parameters;
- strongest lines in the X-ray powder diffraction pattern;
- type specimen repository and specimen number;
- citation details for the mineral prior to publication of full description.

Citation details concern the fact that this information will be published in the *European Journal of Mineralogy* on a routine basis, as well as being added month by month to the commission's website.

It is still a requirement for the authors to publish a full description of the new mineral.

No other information will be released by the commission.

1 New mineral proposals approved in August 2021

IMA no. 2021-041

Kiryuite

$\text{NaMnAl}(\text{PO}_4)\text{F}_3$

Kyu

Tsukubara, city of Kiryu, Gunma Prefecture, Japan
(36°30'41" N, 139°25'26" E)

Daisuke Nishio-Hamane*, Issei Ikari, and Yoshihiro Ohara

*E-mail: hamane@issp.u-tokyo.ac.jp

The Mn analogue of viitaniemiite

Monoclinic: $P2_1/m$; structure determined

$a = 5.425(4)$, $b = 7.128(4)$, $c = 6.817(6)$ Å, $\beta = 109.41(7)^\circ$
3.213(57), 3.124(26), 2.923(53), 2.877(100), 2.560(57),
2.305(27), 2.263(43), 2.155(76)

Type material is deposited in the mineralogical collections of the National Museum of Nature and Science, Amakubo 4-1-1, Tsukuba, Japan, specimen number NSM-M48724

3 Nomenclature/classification proposals approved in September 2021

3.1 An end-member formula for humite, $\text{Mg}_7(\text{SiO}_4)_3\text{F}_2$

The humite polysomatic series consists of a set of minerals with the general formula $n[\text{Mg}_2(\text{SiO}_4)] \cdot \text{Mg}(\text{OH},\text{F})_2$, with $n = 1, 2, 3$, or 4 . The valid species and their corresponding chemical formulae, taken from the current IMA List of Minerals, are as follows.

($n = 1$)

($n = 2$)

($n = 3$)

Humite, $\text{Mg}_7(\text{SiO}_4)_3(\text{F},\text{OH})_2$

($n = 4$)

Clinohumite, $\text{Mg}_9(\text{SiO}_4)_4\text{F}_2$

Hydroxylclinohumite, $\text{Mg}_9(\text{SiO}_4)_4(\text{OH})_2$.

The only species without an end-member formula is humite, $\text{Mg}_7(\text{SiO}_4)_3(\text{F},\text{OH})_2$, which has both fluorine and hydroxyl within the same brackets. As in the whole series a root name without a prefix is used for the fluorine end-member, whereas the same root name with the prefix “hydroxyl-” is used for the hydroxyl end-member; the formula $\text{Mg}_7(\text{SiO}_4)_3\text{F}_2$ has to be assigned to the mineral humite. This is an executive decision taken by the officers of the IMA-CNMNC.

3.2 Renaming of gismondine

Following the report of the zeolite subcommittee, after the approval of the new mineral IMA 2021-043 – gismondine-Sr (see this Newsletter), “gismondine” becomes a series name. Accordingly the mineral previously known as gismondine is renamed gismondine-Ca.

3.3 IMA 20-F: chabournéite group

Proposal 20-F is accepted, and the chabournéite group is established. The group includes the minerals chabournéite, protochabournéite, dalnegroite, shimenite, and dewitite. All members of this group are triclinic, space group $P\bar{1}$, with the exception of dalnegroite, which has space group $P1$.

The ideal formulae of protochabournéite and chabournéite are revised as follows:

protochabournéite – $\text{Tl}_{4-x}\text{Pb}_{2+2x}\text{Sb}_{20-x-y}\text{As}_y\text{S}_{34}$ (with $0.02 \leq x \leq 0.34$, $5.71 \leq y \leq 6.69$).

chabournéite – $\text{Ag}_z\text{Tl}_{8-x-z}\text{Pb}_{4+2x}\text{Sb}_{40-x-y}\text{As}_y\text{S}_{68}$ (with $0.00 \leq x \leq 0.40$, $16.15 \leq y \leq 19.11$, $0.04 \leq z \leq 0.11$).

3.4 IMA 21-D: redefinition of beraunite and discreditation of eleonorite

Proposal 21-D is accepted. The formula of beraunite is revised as $\text{Fe}_6^{3+}(\text{PO}_4)_4\text{O}(\text{OH})_4 \cdot 6\text{H}_2\text{O}$, based on new EMPA, Mössbauer, and SCXRD data obtained on type material. Eleonorite is discredited, as it is identical to beraunite.

3.5 IMA 21-E: redefinition of minyulite

Proposal 21-E is accepted, and the formula of minyulite is redefined as $\text{KAl}_2(\text{PO}_4)_2\text{F} \cdot 4\text{H}_2\text{O}$, based on new EMPA data obtained on holotype material, which confirmed that the mineral is (OH)-free and has F as a species-forming constituent.
